ACCESS TO HEALTHCARE CAMPAIGN FINAL REPORT

BUILDING URBAN PROMISE FROM URBAN POVERTY

In Partnership with Focusing Philanthropy

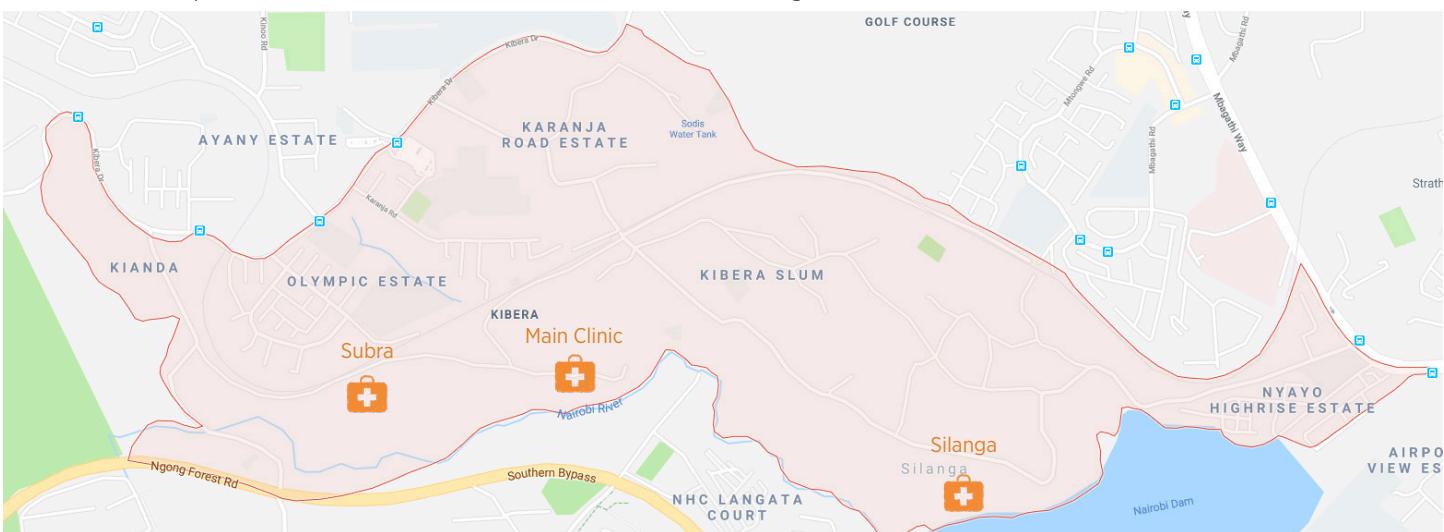

Campaign Summary:

In partnership with Focusing Philanthropy, the 2016 Access to Healthcare Campaign raised \$400,000 to dramatically expand access to high quality healthcare for the residents of the slum communities of Kibera. This campaign funded the construction and operation costs for the Subra and Silanga satellite clinics in Kibera. In 2017, Subra is predicted to serve 12,000 beneficiaries and Silanga is predicted to serve 20,000 beneficiaries.

The Subra and Silanga satellite health clinics officially launched on February 23, 2017. As their first year in operation comes to a close, this report contains detailed information about the services in each clinic, updates about each clinic's impact, photos of patients being served, stories from our beneficiaries, and an expense report detailing the allocation of funds from this campaign.

Thanks to your support, we have seen a noticeable difference in the health status of members of Kibera's Subra and Silanga communities. The most salient differences we have seen include improved nutritional status and treatment outcomes for children in these communities. Additionally, adults are seeking early treatment thanks to the increased access to primary care services and the availability of pharmaceuticals and lab services. In the Subra and Silanga satellite health clinics, an increasing number of pregnant women are enrolling in our antenatal care program. Finally, our prevention of mother to child transmission of HIV program has been very successful in these clinics thanks to early diagnosis and referral for more specialized care at SHOFCO's main clinic.

The below map shows the locations of the Subra and Silanga satellite clinics in the Kibera slum:

Subra Satellite Health Clinic Update

Our Subra satellite health clinic is projected to serve 12,000 beneficiaries in 2017, and is well on its way to reaching this goal. This clinic contains the following departments: registration, metrics and evaluation, clinicians, triage, a lab, and a pharmacy. The Subra Clinic offers consultation, laboratory services, pharmaceuticals, daily patient health education, nutrition screening and treatment, antenatal care, postnatal care, maternal and child health services, family planning, and immunization of children under five.

Current Staff Members at the Subra health clinic include: two nurses, one community health worker, one clinician, one lab technician, one pharmacy technician, one janitor, one receptionist, one security guard, and one metrics and evaluation data clerk. One day per week, a nutritionist and a social worker see patients at the Subra clinic.

The Subra health clinic picked up much faster than we thought after its launch in February. The Subra community embraced SHOFCO's health services with open arms. Our Subra staff are some of our best, and the patients have been thrilled with their experience receiving treatment there. There are no major challenges facing the Subra clinic at this time, and they are most excited about their recent acquisition of an ultrasound scan machine and a vital signs monitor from General Electric. We have also been very successful with our community outreaches in other villages in Kibera, sharing the services being offered at the Subra clinic to attract more patients.

Subra Clinic Impact

The Subra satellite health clinic serves an average of 1,421 patients per month, with an average cost per patient of \$6.06. The average number of monthly patients broken down by program can be seen in the chart below. While we are incredibly excited about Subra's impact, these numbers are a little lower than the clinic's full capacity. This is due to Kenya's two presidential elections in August and October, when we closed the clinic among the rest of SHOFCO's operations.

Health Service	Avg. Number of Monthly Patients Served
Primary Healthcare	1,094 patients
Antenatal Care	31 patients
Postnatal Care	5 patients
Child Welfare Services	64 patients
Nutrition	255 patients
Family Planning	22 patients

Subra Clinic Laboratory

The Subra satellite health clinic has a very active laboratory, and has conducted the following lab tests since launching in February:

Lab Test	Tests Administered (as of 10/31)
Malaria	1,539
Stool Analysis	125
Urine Analysis	790
Blood Sugar	186
Pregnancy Test	318
Rheumatoid Factor	60
Hepatitis A/B/C	111
H-Pylori	594
VRDL	216
Brucellosis	38
Blood Grouping	153
Sickle Cell Test	3
Hemaglobin Level	555

Beneficiary Spotlight | Mercyline Maroche

Mercyline Maroche is a 24 year old college student who lives near the Subra satellite clinic. She enrolled in our antenatal care program during her first trimester, and visited the clinic four times before she went to the hospital to deliver her twins. Her twins, Abigail and Nadia, were born healthy on July 10th. Mercyline credits the close proximity of the Subra satellite clinic that made it possible for her to both receive health services and attend her afternoon classes. Since delivering her twins, she has attended the postnatal clinic and her girls are currently receiving care through our child welfare services and immunization programs.

Silanga Satellite Health Clinic Update

Our Silanga satellite health clinic is projected to serve 20,000 beneficiaries in 2017, and is well on its way to reaching this goal. This clinic contains the same departments and staff as those in Subra clinic, but is much larger. Additional staff included in the Silanga satellite an additional clinician and community health worker, and a social worker and nutritionist present four days per week. Additionally, the Silanga clinic includes a separate maternal and child health room, and is closer to SHOFCO's main clinic which makes referrals for specialized services easier.

The Silanga health clinic is doing very well, and are meeting their monthly targets. The Silanga community has truly embraced the clinic and all of the services provided. Silanga also received an ultrasound scan machine and a vital signs monitor from General Electric, and we are excited about the improved services that they can now provide to their antenatal care patients. One challenge currently facing the Silanga clinic is the condition of the road that it is on. The road is very narrow, and during rainy season the conditions are very poor, making it difficult to reach the Silanga clinic.

Silanga Clinic Impact

The Silanga satellite health clinic serves an average of 2,865 patients per month, with an average cost per patient of \$5.57. The average number of monthly patients broken down by program can be seen in the chart below. As with Subra's impact, these numbers are a little lower than the clinic's full capacity. This is due to Kenya's two presidential elections in August and October, when we closed the clinic among the rest of SHOFCO's operations.

Health Service	Avg. Number of Monthly Patients Served
Primary Healthcare	2,267 patients
Antenatal Care	108 patients
Postnatal Care	10 patients
Child Welfare Services	115 patients
Nutrition	332 patients
Family Planning	33 patients

Silanga Clinic Laboratory

The Subra satellite health clinic has a very active laboratory, and has conducted the following lab tests since launching in February:

Lab Test	Tests Administered (as of 10/31)
Malaria	3,435
Stool Analysis	292
Urine Analysis	2,036
Blood Sugar	1,028
Pregnancy Test	807
Rheumatoid Factor	19
Hepatitis A/B/C	4
H-Pylori	861
VRDL	945
Blood Grouping	244
Sickle Cell Test	9
Hemaglobin Level	1,685
Full Blood Count	897

Beneficiary Spotlight | Jildrine Ng'endo

Jildrine Ng'endo is a baby girl who is 14 months old. She lives with her 19 year old mother and grandmother in the Soweto village of Kibera, near Silanga. Jildrine's mother is unemployed, and her grandmother is the breadwinner for the family.

Jildrine was brought to the clinic, and at triage it was discovered that she was underweight for her age. At 10 months old, she only weighed 15 pounds. Her mid-upper arm circumference was 12.2, which according to the World Health Organization means that she had moderate malnutrition.

Jildrine then saw the clinician for treatment, and then saw the nutritionist for investigation and management. She was immediately enrolled in our nutrition program, and was put on a special nutrition supplement of fortified blended flour. After this initial visit, Jildrine and her mother attended weekly follow up visits with the nutritionist to ensure adherence to the intervention and monitor progress. After three months of treatment, Jildrine weighed 19 pounds and her mid-upper arm circumference was 12.9. She is now reaching her nutrition milestones, and has been discharged from SHOFCO's nutrition program.

SPECIAL THANKS

From the entire team at Shining Hope for Communities, thank you to the entire team at Focusing Philanthropy for your never-ending support. Within the past year we have been able to expand and build new programs, allowing us to impact over two hundred thousand individuals. This tremendous growth has been made possible because of you. We look forward to exploring more ways that we can continue this meaningful partnership.
